

Figure 26-1: Whois Service Network Diagram. *By distributing Whois service across multiple resolution sites, Whois transactions are highly available and performed with low latency.*

Component	Implementation/Configuration
Load Balancers	<ul style="list-style-type: none"> • Deployed as a pair for maximum availability and resilience. • Help ensure workload is evenly distributed across all systems within the .MED gTLD resolution network.
Layer-3 Switches	<ul style="list-style-type: none"> • Four switches are installed in Verisign's resolution network environment: two for front-office management, and two for back-office management. • Switches provide both routing and switching for the .MED gTLD environment across the front-office network.
Terminal Servers	<ul style="list-style-type: none"> • Deployed as a pair of terminal servers to enable out-of-band management of all network hardware. • Used in the event that primary network access is unavailable at Verisign's primary resolution sites.
Virtual Private Networks (VPN)	<ul style="list-style-type: none"> • Pair of VPNs installed at each of Verisign's primary resolution sites for secure remote access to the installed systems.
Commodity Servers	Supporting Whois data processing needs, each commodity server consists of the following specifications: <ul style="list-style-type: none"> • Two central processing units (CPUs) • 2 – 6 gigabytes (GB) random access memory (RAM) (as dictated by the server function) • 2x73GB hard drive
Database Servers	Supporting Whois data processing needs, each database server consists of the following specifications: <ul style="list-style-type: none"> • 16 cores (4 x quad-core CPUs) • 64GB RAM • 5x73GB hard drive

Figure 26-2: Whois IT and Infrastructure Resources. Verisign uses a common Whois resolution network architecture at each primary site provisioning the Whois service.

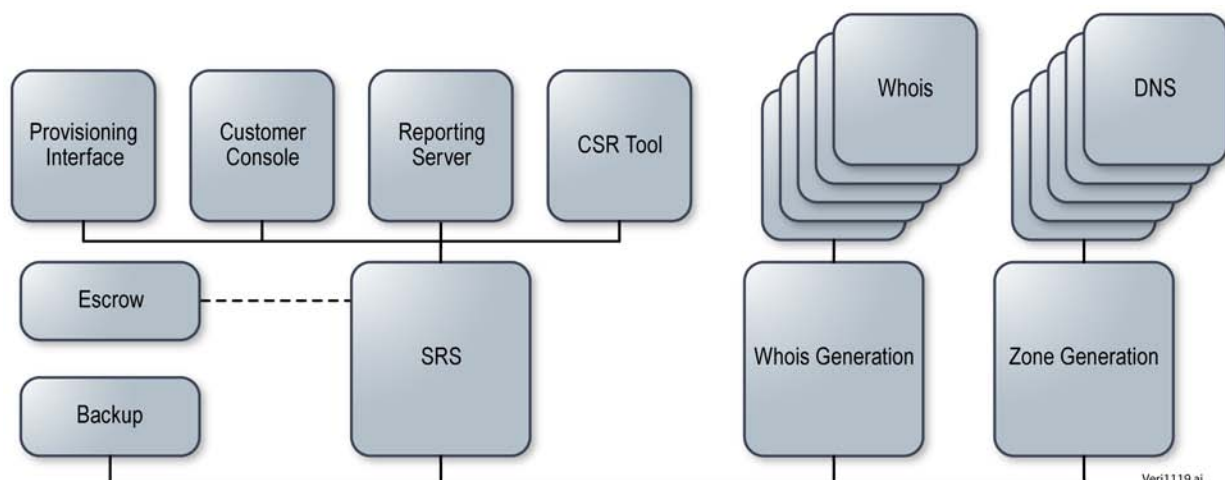

Figure 26-3: Technical Overview. Verisign's Whois services are co-located at DNS locations.

Potential Abusive Searchable Whois Risks	Verisign Risk Mitigation
<p>Single Source Data Mining</p> <p>The mining of Whois data from a single IP address conducted through manual queries</p>	<p>Access Control Lists (ACL): Implementation of an ACL at the network layer to block the offending IP address for a specified period of time; viable option given a single unique IP address</p> <p>Application Rate Limiting: Implementation of rate-limiting at the application layer to regulate the number of queries allowed from the source IP address for a specified period of time; viable option given a single unique IP address</p>
<p>Automated Data Mining</p> <p>Single Source: The mining of Whois data from a single IP address conducted through the use of automated scripts</p> <p>Distributed: The mining of Whois data from multiple sources/IP addresses conducted through the use of automated scripts, or, "botnets"</p>	<p>ACL and Application Rate Limiting as defined for single source data mining</p> <p>Packet Inspection: Implementation of tools that analyze the incoming "get" request to determine whether the source is a valid user or whether the request is coming from an automated script or botnet; viable option based on "get" request signature</p> <p>Completely Automated Public Turing Test To Tell Computers And Humans Apart (CAPTCHA) Techniques: Implementation of a challenge-response test prior to processing the request; viable option that limits ability to predict challenge-response; almost always requires manual interaction</p>

Figure 26-7: Potential Searchable Whois Forms of Abuse and Mitigation. *Verisign leverages its experience supporting the .name registry to build in to the system the safeguards necessary to minimize abusive Whois practices.*
