| Registry<br>Service  | Description of Technical Component  | Description of Business<br>Component   |
|--|---|--|
| A. Receipt of<br>data from<br>registrars<br>concerning<br>registrations of<br>domain names<br>and name<br>servers  | The Verisign-operated registry accepts<br>registration information for domain names and<br>name servers from registrars using the IETF<br>EPP as defined in RFCs 3915, 5730 – 5734,<br>and 5910. For more information about EPP<br>please see the response to Question 25, EPP.   | All registry systems under Verisign's<br>management use EPP with no<br>security or stability issues.<br>Approximately 915 registrars use the<br>Verisign EPP service, and Verisign,<br>as a company, has handled more<br>than 140 million EPP transactions<br>daily without performance issues.  |
| B. Dissemination<br>of TLD zone files  | Verisign disseminates top-level domain (TLD)<br>zone files through its Domain Name System<br>(DNS) resolution infrastructure, which fully<br>complies with all IETF DNS specifications.<br>Verisign ensures updates are processed and<br>distributed rapidly to meet end-user needs. In<br>addition, Verisign, as a company, provides<br>DNS resolution services through its globally<br>distributed constellation of resolution sites,<br>which currently process an average of 60<br>billion queries per day. Question 35, DNS<br>Service provides details of zone file<br>dissemination.   | Any TLD must have the capability to<br>quickly and accurately distribute<br>zone information to a set of globally<br>distributed name servers. In<br>Verisign's experience, end users<br>demand rapid updates of zone<br>information in the DNS. Verisign's<br>system supports this capability in full<br>compliance with applicable RFCs by<br>updating its zone files incrementally<br>every three minutes with a complete<br>zone update every 12 hours.  |
| C. Dissemination<br>of contact and<br>other information<br>concerning<br>domain name<br>registrations<br>(i.e., port-43<br>WHOIS, Wedb-<br>based Whois,<br>RESTful Whois<br>service) | Verisign uses the Whois service as defined in<br>RFC 3912 to disseminate contact and other<br>information regarding registered data objects.<br>Like all other components of its registry<br>service, Verisign's Whois system is designed<br>and built for both reliability and performance.<br>Its current Whois implementation has<br>answered more than five billion Whois queries<br>per month for the TLDs it manages, and has<br>experienced more than 250,000 queries per<br>minute in peak conditions. Verisign commits<br>to implementing a RESTful Whois service<br>upon finalization of agreements with the IETF.<br>For more information about Whois, please see<br>the response to Question 26, Whois.   | The Whois service facilitates the<br>timely resolution of many technical<br>problems, assists investigatory<br>phases of law enforcement, and<br>provides many other legitimate, non-<br>abusive uses of domain name<br>registration meta-data. One of the<br>fastest growing uses for Whois data<br>today is in the automated, analytic<br>engines of Internet reputation<br>services used to prevent spam and<br>combat Internet-based identity<br>crimes such as phishing.  |
| D. International-<br>ized domain<br>names (IDNs)   | Verisign's registry system supports the<br>registration and resolution of IDNs. Verisign<br>contributes to the IDN standards process as a<br>member of the IETF, which has led the effort<br>to create standards for using non-ASCII<br>characters in the DNS. Verisign is the leading<br>backend registry provider for IDNs at the<br>second level and has played a key role in the<br>development and proliferation of standards<br>that are meaningful to communities that use<br>non-Latin scripts. IDNs improve the<br>accessibility and functionality of the Internet<br>by enabling domain names in non-ASCII<br>characters. The development of IDNs requires<br>cooperation and communication among the<br>various organizations and individuals who are<br>responsible for the technologies, systems,<br>and protocols of the Internet. The response to<br>Question 44 provides IDN details. | Most domain names are registered in<br>ASCII characters (A to Z, 0 to 9, and<br>the hyphen "-"). However, non-<br>English words that require diacritics,<br>such as Spanish and French, and<br>languages that use non-Latin scripts,<br>such as Kanji and Arabic, cannot be<br>rendered in ASCII. As a result,<br>millions of Internet users struggle to<br>find their way online using non-native<br>scripts and languages. Verisign's<br>registry system complies with IDN-<br>related industry standards and<br>supports IDN services that enable<br>Internet users to access websites in<br>their local language characters and<br>help global organizations protect and<br>secure their brands. |

| Registry<br>Service | Description of Technical Component  | Description of Business<br>Component   |
|---------------------|---|--|
| E. DNSSEC           | Verisign's registry system supports the<br>registration and resolution of DNSSEC-<br>enabled domain names. Verisign's DNSSEC<br>implementation provides end-to-end<br>authenticity and integrity and helps protect the<br>Internet from certain types of attacks, such as<br>man-in-the-middle and cache poisoning<br>attacks. Verisign has always worked closely<br>with the Internet community in the<br>development of standards and solutions<br>related to topics of Internet security, including<br>DNSSEC. Verisign recognizes that Internet<br>security is constantly evolving, and DNSSEC<br>is one of many measures that are currently<br>underway to enhance security on the Internet.<br>Please see the response to Question 43,<br>DNSSEC, for details of Verisign's approach. | DNS was not originally designed with<br>strong security mechanisms to<br>provide integrity and authenticity of<br>DNS data. Over the years, a number<br>of vulnerabilities have been<br>discovered that threaten the<br>reliability and trustworthiness of the<br>system. DNSSEC addresses these<br>vulnerabilities by adding data origin<br>authentication, data integrity<br>verification, and authenticated denial<br>of existence capabilities to the DNS. |

**Figure 23-1: Registry Services.** Each proposed service has been previously approved by ICANN to ensure registry security and stability.
