

Figure 26-1: Whois Service Network Diagram. By distributing Whois service across multiple resolution sites, Whois transactions are highly available and performed with low latency.

| Component | Implementation/Configuration |
|---------------------------------------|---|
| Load Balancers | <ul style="list-style-type: none"> • Deployed as a pair for maximum availability and resilience. • Help ensure workload is evenly distributed across all systems within the .airbus gTLD resolution network. |
| Layer-3 Switches | <ul style="list-style-type: none"> • Four switches are installed in Verisign's resolution network environment: two for front-office management, and two for back-office management. • Switches provide both routing and switching for the .airbus gTLD environment across the front-office network. |
| Terminal Servers | <ul style="list-style-type: none"> • Deployed as a pair of terminal servers to enable out-of-band management of all network hardware. • Used in the event that primary network access is unavailable at Verisign's primary resolution sites. |
| Virtual Private Networks (VPN) | <ul style="list-style-type: none"> • Pair of VPNs installed at each of Verisign's primary resolution sites for secure remote access to the installed systems. |
| Commodity Servers | <p>Supporting Whois data processing needs, each commodity server consists of the following specifications:</p> <ul style="list-style-type: none"> • Two central processing units (CPUs) • 2 – 6 gigabytes (GB) random access memory (RAM) (as dictated by the server function) • 2x73GB hard drive |
| Database Servers | <p>Supporting Whois data processing needs, each database server consists of the following specifications:</p> <ul style="list-style-type: none"> • 16 cores (4 x quad-core CPUs) • 64GB RAM • 5x73GB hard drive |

Figure 26-2: Whois IT and Infrastructure Resources. *Verisign uses a common Whois resolution network architecture at each primary site provisioning the Whois service.*

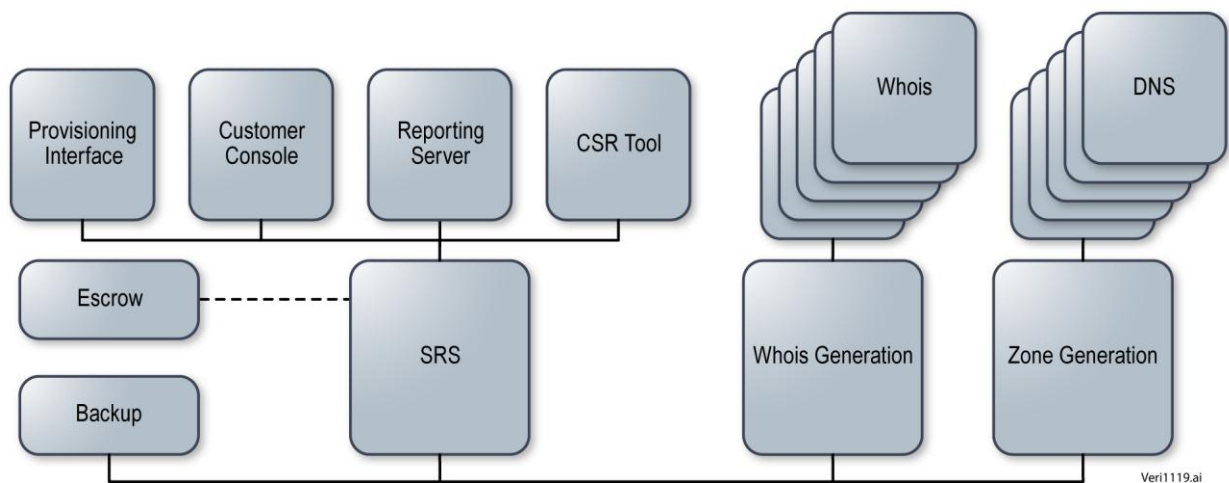

Figure 26-3: Technical Overview. *Verisign's Whois services are co-located at DNS locations.*

| Potential Abusive Searchable Whois Risks | Verisign Risk Mitigation |
|---|---|
| <p>Single Source Data Mining The mining of Whois data from a single IP address conducted through manual queries</p> | <p>Access Control Lists (ACL): Implementation of an ACL at the network layer to block the offending IP address for a specified period of time; viable option given a single unique IP address Application Rate Limiting: Implementation of rate-limiting at the application layer to regulate the number of queries allowed from the source IP address for a specified period of time; viable option given a single unique IP address</p> |
| <p>Automated Data Mining Single Source: The mining of Whois data from a single IP address conducted through the use of automated scripts Distributed: The mining of Whois data from multiple sources/IP addresses conducted through the use of automated scripts, or, "botnets"</p> | <p>ACL and Application Rate Limiting as defined for single source data mining Packet Inspection: Implementation of tools that analyze the incoming "get" request to determine whether the source is a valid user or whether the request is coming from an automated script or botnet; viable option based on "get" request signature Completely Automated Public Turing Test To Tell Computers And Humans Apart (CAPTCHA) Techniques: Implementation of a challenge-response test prior to processing the request; viable option that limits ability to predict challenge-response; almost always requires manual interaction</p> |

Figure 26-7: Potential Searchable Whois Forms of Abuse and Mitigation. *Verisign leverages its experience supporting the .name registry to build in to the system the safeguards necessary to minimize abusive Whois practices.*
